

On the Ordering of Baby Keys

Comically small module, in a form of simplicity.

See [Appendix ORDER](#) for identifying modules in Ordered Keys family.

This small module consists of 3 colored keys, each of which is labeled with a colored number.

The possible colors for both the keys and the numbers labeling them are: (R)ed, (G)reen, (B)lue.

To disarm this module, complete 2 stages by pressing the keys in the correct order.

Each key has a value corresponding its position, the color of the label and the color of the key. Its corresponding sequence of values to press is determined by the labels of the keys.

- The table to use has a top-left digit equal to the position of the key, from left to right, 1 being the left-most key.
- The color of the label and the color of the key represents the row and column respectively.

1	R	G	B
R	1	2	3
G	2	3	1
B	3	1	2

2	R	G	B
R	2	3	1
G	3	1	2
B	1	2	3

3	R	G	B
R	3	1	2
G	1	2	3
B	2	3	1

- If all 3 digits are distinct, find that combination in parentheses and use the sequence assigned to the parentheses.
- Otherwise, use A as the digit displayed the most, and B (the Nth left-most digit of the serial number), modulo 2, where N is the stage number, counting from 1.

	A		
B	1	2	3
0	1,2,3 (3,2,1)	2,3,1 (3,1,2)	3,1,2 (2,1,3)
1	2,1,3 (1,3,2)	1,3,2 (2,3,1)	3,2,1 (1,2,3)
